

Core Concepts & Commands

Basic Concepts

Project (Namespace): A logical grouping of resources, like a Kubernetes namespace.

Pod: The smallest deployable unit, containing one or more containers.

Service: Exposes an application running on a set of Pods as a network service.

Route: Exposes a service to the outside world.

DeploymentConfig: Defines the desired state of your application deployments.

Image Stream: Manages container images and their tags.

Common `oc` Commands

| | |
|------------------------------------|--|
| <code>oc login</code> | Log in to the OpenShift cluster. |
| <code><openshift_url></code> | |
| <code>oc new-project</code> | Create a new project (namespace). |
| <code><project_name></code> | |
| <code>oc project</code> | Switch to a specific project. |
| <code><project_name></code> | |
| <code>oc get pods</code> | List all pods in the current project. |
| <code>oc create -f</code> | Create resources from a YAML file. |
| <code><file.yaml></code> | |
| <code>oc apply -f</code> | Apply changes to resources defined in a YAML file. |
| <code><file.yaml></code> | |

Resource Management

| | |
|------------------------------------|---|
| <code>oc describe</code> | Get detailed information about a resource. |
| <code><resource_type></code> | |
| <code><resource_name></code> | |
| <code>oc delete</code> | Delete a resource. |
| <code><resource_type></code> | |
| <code><resource_name></code> | |
| <code>oc edit</code> | Edit a resource directly. |
| <code><resource_type></code> | |
| <code><resource_name></code> | |
| <code>oc logs</code> | View the logs of a pod. |
| <code><pod_name></code> | |
| <code>oc exec -it</code> | Execute a command inside a pod. |
| <code><pod_name> --</code> | Example: <code>oc exec -it my-pod --</code> |
| <code><command></code> | <code>bash</code> |

Deployments and Services

DeploymentConfig Basics

DeploymentConfigs manage application deployments. They define the desired state (number of replicas, container image, etc.) and automatically roll out updates.

Use `oc new-app` to quickly create a DeploymentConfig from a container image or Git repository.

Example creating DeploymentConfig from image:

```
oc new-app openshift/hello-openshift --name=my-app
```

Service Management

| | |
|---|--|
| <code>oc expose</code> | Create a service to expose a DeploymentConfig. |
| <code>dc/<deployment_conf_ig_name></code> | |
| <code>oc get svc</code> | List services in the current project. |
| <code>oc describe</code> | Get details about a service. |
| <code>svc/<service_name></code> | |

Rolling Updates

OpenShift supports rolling updates to minimize downtime during deployments. When you update a DeploymentConfig, OpenShift automatically updates the application instances without interrupting service.

To trigger a new deployment after changing the DeploymentConfig, use:

```
oc rollout latest dc/<deployment_config_name>
```

Scaling Applications

| | |
|--|--|
| <code>oc scale</code> | Scale the number of replicas for a DeploymentConfig. |
| <code>dc/<deployment_config_name> --replicas=<number></code> | |
| <code>oc autoscale</code> | Configure autoscaling for a DeploymentConfig. |
| <code>dc/<deployment_config_name> --min=<min_replicas> --max=<max_replicas></code> | |

Routes and Networking

Route Configuration

Routes expose services to external traffic. They define the hostnames and paths that external clients use to access your applications.

Use `oc expose` to quickly create a route for a service:

```
oc expose svc/<service_name> --hostname=<desired_hostname>
```

Route Management Commands

| | |
|---------------------------------------|-------------------------------------|
| <code>oc get routes</code> | List routes in the current project. |
| <code>oc describe</code> | Get details about a specific route. |
| <code>route/<route_name></code> | |
| <code>oc delete</code> | Delete a route. |
| <code>route/<route_name></code> | |

Securing Routes with TLS

You can secure routes using TLS certificates. OpenShift supports edge, passthrough, and re-encrypt TLS termination.

To configure TLS, you'll need to create a secret containing your TLS certificate and key, and then reference that secret in your route definition.

Example of creating secret:

```
oc create secret tls my-tls-secret --cert=path/to/cert.pem --key=path/to/key.pem
```

Builds and Image Streams

Build Concepts

Builds transform source code into runnable container images. OpenShift supports different build strategies, including Docker, Source-to-Image (S2I), and custom builds.

BuildConfigs define how builds are executed.

Image Streams

Image Streams manage container image tags and provide a level of indirection between deployments and the underlying images. This allows you to update images without modifying your deployment configurations.

When a new image is pushed to the registry, OpenShift can automatically trigger new deployments based on the updated Image Stream tags.

Common Build Commands

```
oc new-build <git_repo_url> --name=<build_name>
```

Create a new build configuration from a Git repository (S2I).

```
oc start-build <build_name>
```

Start a build.

```
oc get builds
```

List builds in the current project.

```
oc logs build/<build_name>
```

View the logs of a build.

Working with Image Streams

```
oc import-image <image_name> --from=<registry_url>/<image_name> --confirm
```

Import an image from a registry into an Image Stream.

```
oc get imagestreams
```

List Image Streams in the current project.

```
oc describe imagestream/<imagestream_name>
```

Get details about an Image Stream.
