

Homebrew Cheat Sheet

A comprehensive guide to Homebrew, the package manager for macOS. This cheat sheet covers installation, basic commands, package management, and troubleshooting.

Installation and Setup

Installation

To install Homebrew, open your terminal and run the following command:

/bin/bash -c "\$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/ins

tall/HEAD/install.sh)"

This script will guide you through the installation process. Follow the prompts, and enter your password if required.

Basic Setup

After installation, it's important to add Homebrew to your PATH so that you can run brew commands from any terminal location.

Add these lines to your .zshrc or .bashrc file:

export PATH="/opt/homebrew/bin:\$PATH"

Then, apply the changes to your current session:

source ~/.zshrc # or source ~/.bashrc

Alternatively, for interactive setup in zsh, run:

eval "\$(/opt/homebrew/bin/brew shellenv)"

Verify Installation

To ensure Homebrew is installed correctly, run:

brew doctor

This command will diagnose common issues and provide solutions.

If any problems are reported, follow the suggested steps to resolve them before proceeding.

Package Management

Installing Packages

brew install <package_name></package_name>	Installs the specified package.
	Example:
	brew install git
brew reinstall	Reinstalls the specified package.
<pre><package_name></package_name></pre>	Useful for fixing broken installations.
	Example:
	brew reinstall git
brew install	Installs a specific version of a
<formula>@<vers< td=""><td>formula.</td></vers<></formula>	formula.
ion>	Example:
	brew install node@16

Updating Packages

brew update	Updates Homebrew's package list.
brew upgrade	Upgrades all outdated packages.
