

Basic Commands

Image Management

<code>docker build [options] .</code>	Builds an image from a Dockerfile in the current directory.
Options:	
<code>-t <image_name></code>	: Tags the image with a name.
<code>--build-arg <var>=<value></code>	: Sets build-time variables.
Example:	
<code>docker build -t myapp:latest .</code>	
<code>docker pull <image_name></code>	Pulls an image from Docker Hub or a registry.
Example:	
<code>docker pull ubuntu:latest</code>	
<code>docker images [options]</code>	Lists available images.
Options:	
<code>-a</code>	: Shows all images, including intermediate image layers.
Example:	
<code>docker images</code>	
<code>docker rmi <image_id></code>	Removes an image.
Example:	
<code>docker rmi b750fe78269d</code>	
<code>docker image prune [options]</code>	Removes unused images.
Options:	
<code>-a</code>	: Remove all unused images, not just dangling ones.
Example:	
<code>docker image prune -a</code>	

Container Management

<code>docker run [options] <image></code>	Creates and starts a container from an image.
Options:	
<code>-d</code>	: Detached mode (run in background).
<code>-i</code>	: Interactive mode.
<code>-t</code>	: Allocate a pseudo-TTY.
<code>--name <name></code>	: Assign a name to the container.
<code>-p <host_port>:<container_port></code>	: Port mapping.
<code>-v <host_path>:<container_path></code>	: Volume mounting.
<code>-e <VAR>=<value></code>	: Set environment variables.
Example:	
<code>docker run -d -p 80:80 nginx</code>	
<code>docker create [options] <image></code>	Creates a container but does not start it.
Example:	
<code>docker create --name my_container ubuntu</code>	
<code>docker start <container_id></code>	Starts a stopped container.
Example:	
<code>docker start my_container</code>	
<code>docker stop <container_id></code>	Stops a running container.
Example:	
<code>docker stop my_container</code>	
<code>docker restart <container_id></code>	Restarts a container.
Example:	
<code>docker restart my_container</code>	
<code>docker rm [options] <container_id></code>	Removes a stopped container.
Options:	
<code>-f</code>	: Force removal of a running container.
Example:	
<code>docker rm my_container</code>	

Inspecting and Interacting with Containers

Container Inspection

<code>docker ps [options]</code>	Lists running containers. Options: <code>-a</code> : Shows all containers, including stopped ones. <code>-q</code> : Only display numeric IDs. Example: <code>docker ps -a</code>
<code>docker inspect <container_id></code>	Displays detailed information about a container. Example: <code>docker inspect my_container</code>
<code>docker logs [options] <container_id></code>	Fetches the logs of a container. Options: <code>-f</code> : Follow log output. <code>--tail <n></code> : Output the last n number of lines. Example: <code>docker logs -f my_container</code>
<code>docker top <container_id></code>	Displays the processes running inside a container. Example: <code>docker top my_container</code>
<code>docker stats [options] <container_id></code>	Displays resource usage statistics for a container. Example: <code>docker stats my_container</code>

Interactive Container Operations

<code>docker exec [options] <container_id> <command></code>	Executes a command inside a running container. Options: <code>-i</code> : Interactive mode. <code>-t</code> : Allocate a pseudo-TTY. <code>-d</code> : Detached mode. <code>-u <user></code> : Username or UID (format: <code><name uid>[:<group gid>]</code>). Example: <code>docker exec -it my_container bash</code>
<code>docker attach <container_id></code>	Attaches your terminal's standard input, output, and error streams to a running container. Example: <code>docker attach my_container</code>
<code>docker kill <container_id></code>	Kills a running container by sending a SIGKILL signal. Example: <code>docker kill my_container</code>
<code>docker pause <container_id></code>	Pauses all processes within a container. Example: <code>docker pause my_container</code>
<code>docker unpause <container_id></code>	Unpauses all processes within a paused container. Example: <code>docker unpause my_container</code>

Docker Volumes and Networking

Volume Management

<code>docker volume create [options] <volume_name></code>	Creates a new volume. Options: <code>--driver <driver_name></code> : Specify volume driver name (e.g., local, nfs). Example: <code>docker volume create my_volume</code>
<code>docker volume ls</code>	Lists all existing volumes. Example: <code>docker volume ls</code>
<code>docker volume inspect <volume_name></code>	Displays detailed information about a volume. Example: <code>docker volume inspect my_volume</code>
<code>docker volume rm <volume_name></code>	Removes a volume. Example: <code>docker volume rm my_volume</code>
<code>docker volume prune</code>	Removes all unused local volumes. Example: <code>docker volume prune</code>

Network Management

<code>docker network create [options] <network_name></code>	<p>Creates a new network.</p> <p>Options:</p> <ul style="list-style-type: none"><code>--driver <driver_name></code>: Specify network driver (e.g., bridge, overlay).<code>--subnet <subnet></code>: Assign subnet address. <p>Example:</p> <pre>docker network create --driver bridge my_network</pre>
<code>docker network ls</code>	<p>Lists all existing networks.</p> <p>Example:</p> <pre>docker network ls</pre>
<code>docker network inspect <network_name></code>	<p>Displays detailed information about a network.</p> <p>Example:</p> <pre>docker network inspect my_network</pre>
<code>docker network connect <network_name> <container_id></code>	<p>Connects a container to a network.</p> <p>Example:</p> <pre>docker network connect my_network my_container</pre>
<code>docker network disconnect <network_name> <container_id></code>	<p>Disconnects a container from a network.</p> <p>Example:</p> <pre>docker network disconnect my_network my_container</pre>
<code>docker network rm <network_name></code>	<p>Removes a network.</p> <p>Example:</p> <pre>docker network rm my_network</pre>
<code>docker network prune</code>	<p>Removes all unused networks.</p> <p>Example:</p> <pre>docker network prune</pre>

Advanced Docker Commands

Docker System Commands

<code>docker system df</code>	<p>Shows Docker disk usage.</p> <p>Example:</p> <pre>docker system df</pre>
<code>docker system events</code>	<p>Gets real-time events from the Docker server.</p> <p>Example:</p> <pre>docker system events</pre>
<code>docker system info</code>	<p>Displays system-wide information about Docker.</p> <p>Example:</p> <pre>docker system info</pre>
<code>docker system prune [options]</code>	<p>Cleans up unused Docker resources.</p> <p>Options:</p> <ul style="list-style-type: none"><code>-a</code>: Remove all unused images and containers.<code>--volumes</code>: Prune volumes as well. <p>Example:</p> <pre>docker system prune -a</pre>

Docker Compose (Orchestration)

<code>docker-compose up</code> <code>[options]</code>	<p>Builds, (re)creates, starts, and attaches to containers defined in a <code>docker-compose.yml</code> file.</p> <p>Options:</p> <ul style="list-style-type: none"><code>-d</code> : Detached mode.<code>--build</code> : Force rebuild images.<code>--scale <service>=<num></code> : Scale a service to a specified number of instances. <p>Example:</p> <pre>docker-compose up -d</pre>
<code>docker-compose down</code> <code>[options]</code>	<p>Stops and removes containers, networks, volumes, and images created by <code>docker-compose up</code>.</p> <p>Options:</p> <ul style="list-style-type: none"><code>--rmi all</code> : Remove all images used by the service. <p>Example:</p> <pre>docker-compose down</pre>
<code>docker-compose ps</code>	<p>Lists the containers created by <code>docker-compose</code>.</p> <p>Example:</p> <pre>docker-compose ps</pre>
<code>docker-compose logs</code> <code>[options] <service></code>	<p>View output from services.</p> <p>Options:</p> <ul style="list-style-type: none"><code>-f</code> : Follow log output. <p>Example:</p> <pre>docker-compose logs -f web</pre>
<code>docker-compose exec</code> <code><service> <command></code>	<p>Execute arbitrary commands within a service's container.</p> <p>Example:</p> <pre>docker-compose exec web bash</pre>
